Textile is the backbone of fashion. It is the fabric that makes a garment look and feel different. The quality of the fabric used in a garment can make a huge difference in its appearance and durability. In this article, we will explore the world of textiles and how they influence fashion trends.

Textiles are made from various fibers, including natural fibers like cotton, wool, and silk, and synthetic fibers like polyester and nylon. Each fiber has unique properties that affect the way a fabric behaves. For example, cotton is soft and breathable, while wool is warm and insulating.

The choice of fabric is crucial in fashion design. Designers often select fabrics that complement the style and theme of their collection. For instance, a designer might choose a heavy, textured fabric for a winter collection or a light, airy fabric for a summer collection. Understanding the properties of different textiles is essential for creating high-quality, fashionable garments.

*Clothing is an item of fabric, usually sewn together to cover part of the human body. Humans are the only animal which wear clothes, and almost all people do today. The top of body can be covered by shirt, tops or sleeves, legs by pants or skirt, hands by gloves, feet by footwear, head by hats, headpieces or scarves. In cold climates, people also wear heavy, thick coats such as trench coats. Clothing protects the human body from the hot sun and light, temperatures, air, other biological organisms. Clothing such as thick wool coats also least keeps the human body warm in very cold*
